SUMMARY

Data Scientist with 4+ years of experience in retail product development and analytics. Proven ability to use statistical algorithms, machine learning, and forecasting techniques to improve the efficiency and effectiveness of marketing campaigns, product development, and supply chain management.
Expertise in market mix modeling and data visualizations.

WORK EXPERIENCE

Latent View Analytics (Feb 2024 - present)

Senior Analyst

Feb 2024-Current

Digital Marketing Optimization - Finance

- Analyzed financial data and developed an MMM model to assess marketing channel impact and strategy effectiveness.
- Implemented an optimization tool to maximize ROAS and provided actionable insights for improved performance and decision-making.
- Streamlined reporting processes through ETL automation, creating dynamic dashboards and regular reports for stakeholders.

Tools used: Python, Microsoft Excel, machine learning models, ETL, Regression models, GCP – (big query, vertex AI), Streamlit.

Predictive Analytics - Communication & Devices (HP)

- Designed and deployed predictive ML models to forecast device part failures (e.g., battery, fan), reducing downtime and enabling proactive maintenance.
- Built classification models to detect non-authentic batteries, combining ML and rule-based logic to improve accuracy and reduce warranty risks.
- Developed interactive dashboards and visualizations to monitor predictions, helping stakeholders make data-driven decisions for part reliability and authenticity.
- Partnered with engineering and product teams to operationalize predictive insights, improving service efficiency and product quality.
- Built LLM-powered serial-number-level summarizers using GPT-4mini, leveraging HTML parsing and rendering to surface complex device telemetry insights directly within dashboard.
- Analyze multi-source device signal (battery health and skin temps, CPU/disk metric, fan noise and thermals, application and port usage, BIOS/OS version) to enable faster root-cause analysis and issue.

Tools used: Python, PySpark, Databricks SQL, AutoML, Tree-based Models (Random Forest, Gradient Boosted Trees), TensorFlow, PyCaret, MLflow, Power BI.

Nielsen IQ (Feb 2020-Dec 2022)

Data Scientist

Mar 2022-Dec 2022

Event Effectiveness modeling tool (EEMS 2.0):

- Revamped product functionalities leveraging Python and Flask, streamlining end-to-end service delivery.
- Evaluate the influence of retail product or CPG campaigns and advertisements on stores sales and market performance through comprehensive market research, incorporating A/B testing methodologies for robust analysis.

Tools used: Python, Ubuntu v18, Docker Containers, Power BI, A/B testing, Difference in difference, LDA

Associate Data Scientist

Nov 2020-Mar 2022

Rate cards:

- Designed end-to-end management of rate cards through JavaScript.
- Engineered a Google Apps Script automating intricate calculations, slashing processing time, and enhancing accuracy. Created an HTML user interface tailored to the client's needs for result viewing. Results are conveniently shared in the form of PDF files.
- Migration of rate card to PowerApps (Microsoft tool).

Tools used: JIRA, Microsoft Power Apps, Advanced Excel, Excel VBA, HTML, Java Script.

Product Harmonization:

Building a robust business model for mapping various concepts to Nielsen's specific hierarchy.

- This task entails consolidating item and category-specific data and attributes, employing NLP-based techniques. to detect similarities among concepts.
- The service was developed and deployed on **Azure Data bricks** using **Spark**, and deep learning with BERT was employed to convert and map the information for results.

Tools used: PySpark - user defined functions (UDFs), Machine Learning - NLP, Hugging face - word2Vec, Glove, TF-IDF, Sentiment Classifiers, Sentence Embedding technique - Deep learning models (Bert model), Microsoft Azure Data bricks.

Consultant Data Science

May 2020 - Nov 2020

Rapid Predict - Market Mix Modelling/Forecasting Platform

- Developed a stand- alone web app which will run the models (using **NAG**) and allow users on merit-based systems (model owner, consultant, users etc.).
- Engineered features including running holdout samples and visualization graphs using **Sea born** and Power BI.
- Roadmap includes integrating the product into the main ecosystem, leveraging **Power BI** for final model representation and client delivery.

Tools used: JIRA, Python, Power BI, MongoDB, ML using NAG, CART Models.

Data science Intern

Feb 2020 - April 2020

Rapid Predict - Market Mix Modelling/Forecasting Platform

- Worked closely with stakeholders to grasp their requirements and structure the product. Additionally, I played a key role in developing a proof of concept (POC) for the final machine learning model in R software, a crucial component of the platform.
- Finalize key business drivers like a **market mix model** by employing **predictive analytics** and creating simulator using forecasting models, thereby enhancing strategic decision- making processes.

Tools used: Python, OOPs concepts - Classes and Object, Git, Flask, R Software, Power BI, MongoDB, ML models (**Time Series Forecasting** – AR, MA, ARIMA, ARIMAX, SARIMA, Regression models, Classification and Regression Trees (CART)).

EDUCATION AND QUALIFICATIONS

M.Sc. in Big Data Analytics **(May 2018 – May 2020)**

B.Sc. in Physics, Mathematics and Chemistry **(May 2014 – May 2017)**

St. Joseph's College, Bangalore University, Bangalore
